

ABSTRACT OF THE DISCLOSURE

- A telecommunication network with a number of terminal devices and a central server of an access or service provider, whereby the server includes an interrogation part for interrogating the hardware and software configurations of the
5 terminal devices and a software transmitting part for loading software and/or data that are suited to the detected hardware and software configuration onto the terminal devices, and whereby the terminal devices include a response transmitting part for transmitting a configuration code to the server identifying the hardware and software configuration.
